## **Project Overview**

#### **Purpose:**

 The ETL Mini Project aims to demonstrate the process of extracting, transforming, and loading data for effective analysis.

#### Goals:

 The project focuses on creating an efficient ETL pipeline to handle crowdfunding and contacts data.

## **Tools and Languages:**

 Python, Pandas, and Postgres are the key tools and languages used for data processing and database management.

## **Data Extraction and Transformation**

Extracting and transforming data from crowdfunding.xlsx and contacts.xlsx files.

Ensure data consistency and suitability for analysis.

Python and Pandas enable efficient data extraction and transformation.

Python dictionary methods or regular expressions facilitate data organization. Creation of separate DataFrames enhances data management and analysis.

# **Category DataFrames**

- The Category DataFrame plays a vital role in organizing and categorizing data within the ETL Mini Project.
- \* The purpose of the Category DataFrame is to provide a structured representation of categories for efficient data management and analysis.

#### **DataFrame Structure:**

- \* The Category DataFrame consists of two columns: category\_id and category.
- \* The category\_id column is sequentially numbered to uniquely identify each category.
- \* The category column contains the titles or names of the categories.

#### **Sequential Numbering**

- Each category is assigned a unique identifier for easy reference and analysis.
- \* Sequential numbering facilitates easy referencing, sorting, and analysis of the categories.

#### **Category Titles**

- Category titles are added to provide meaningful and descriptive labels to each category.
- Category titles enhance the understanding and interpretation of the data and enable effective data analysis.

# Subcategory DataFrame

- The Subcategory DataFrame is an essential component of the ETL Mini Project, contributing to efficient data organization and categorization.
- \* The purpose of the Subcategory DataFrame is to provide a structured representation of subcategories for enhanced data management and analysis.

#### **DataFrame Structure:**

- \* The Category DataFrame consists of two columns: subcategory id and subcategory.
- \* The subcategory\_id column utilizes sequential numbering to assign a unique identifier to each subcategory.
- \* The category column contains the titles or names of the subcategories.

#### Sequential Numbering

- The subcategory\_id column employs sequential numbering to ensure distinct and consistent identification of each subcategory.
- Sequential numbering facilitates easy referencing, sorting, and analysis of the subcategories.

#### **Subcategory Titles**

- The subcategory column holds the titles or names of the subcategories, providing descriptive labels to each subcategory
- Subcategory titles enhance the understanding and categorization of the data, enabling effective data analysis.

# Campaign DataFrame

- \* The Campaign DataFrame is a key component of the ETL Mini Project, designed to store and analyze data related to crowdfunding campaigns.
- \* The purpose of the Campaign DataFrame is to capture and organize important campaign details for further analysis and insights.

#### **Data Type Conversions and DateTime Formatting:**

## Data type conversions and datetime formatting are applied to specific columns:

- \* Specific columns undergo data type conversions and datetime formatting:
  - Numeric data types (integers or floats) are used for goal, pledged, and backers\_count columns to facilitate calculations and analysis.
  - DateTime data type is applied to launch\_date and end\_date columns to store and manipulate date values accurately.
- \* Data type conversions ensure appropriate storage and handling of the campaign data.
- The campaign data undergoes necessary transformations to ensure consistent and accurate data representation.
- \* Proper data types and datetime formatting enable effective analysis and calculations on the campaign DataFrame.

## **Contacts DataFrame**

- The Contacts DataFrame is an essential component of the ETL Mini Project, designed to store and manage contact information.
- \* The purpose of the Contacts DataFrame is to organize and maintain contact details for efficient data processing and analysis.

#### **DataFrame Structure:**

#### Columns:

- \* contact\_id: Unique identifier for each contact
- \* first\_name: First name of the contact
- \* last\_name: Last name of the contact
- \* email: Email address of the contact

#### **Python Dictionary Methods or Regular Expressions:**

- \* The Contacts DataFrame is created using either Python dictionary methods or regular expressions.
- Python dictionary methods can be employed to directly convert contact data into a DataFrame.
- Alternatively, regular expressions can be utilized to extract and structure contact information from raw data.

## **Contacts DataFrame**

Python Dictionary Methods and Regular Expressions

Python dictionary methods and regular expressions were utilized to create the Contacts DataFrame.

#### **Python Dictionary Methods**

- \* Straightforward and intuitive approach for mapping contact attributes to their values.
- \* Simplifies the process of creating and populating the DataFrame.
- \* Provides simplicity and ease of use in organizing contact information.

#### **Regular Expressions**

- Powerful and flexible method for extracting and organizing contact details from unstructured data.
- \* Allows for defining patterns and searching for specific patterns within text data.
- \* Useful for handling complex or varied contact information formats.

#### **Advantages**

- \* Simplicity: Python dictionary methods offer a straightforward syntax for creating the DataFrame, while regular expressions simplify the extraction of specific patterns.
- \* Efficiency: Both methods are efficient in terms of processing time and computational resources.
- Flexibility: Python dictionary methods and regular expressions accommodate various data formats and structures.

# Crowdfunding Database (ERD)

#### <u> Entity-Relationship Diagram (ERD):</u>

- \* The ERD -display represents the relationships between the tables in the crowdfunding database.
- \* The ERD provides a visual overview of how the tables are connected and their associations.

#### **Table Schema Creation Process:**

- \* Steps involved in creating the table schema based on the ERD:
  - \* Identify the entities and their attributes from the ERD.
  - \* Determine the data types and constraints for each attribute.
  - \* Define the primary keys, foreign keys, and relationships between the tables.
  - \* Establish indexes for efficient data retrieval.
  - Ensure data integrity through the use of constraints.

# Crowdfunding Database PostgreSQL

- **Steps involved in creating the table schema based on the PostgreSQL:** 
  - \* The crowdfunding\_db\_schema.sql file is executed in PostgreSQL to create the database schema.
  - \* The table creation statements from the schema file are executed, creating the corresponding tables.
  - Data import processes are performed to populate the tables with data from the extracted and transformed DataFrames.
  - Verification steps ensure the successful creation of the database, including data integrity checks and querying the tables to validate the imported data.
